

# Data-security review: customer data & privacy

---

Focus: **where a buyer's customer PII lives, how it flows, and where it could leak**, with special attention to **AI exposure**.

---

## 0. AI exposure: the short answer is **NONE**

**This product never sends customer data to any AI, LLM, or outside service.** Verified in code:

- **No** `UrIFetchApp` , **no** `fetch` , **no external endpoints of any kind**: the app literally cannot transmit data off the user's Google account.
- **No OpenAI / Anthropic / Gemini / Vertex / any AI API** referenced anywhere.
- The product is **not "AI-powered"**: there is no model call in any feature.

So customer records are **never** fed to an AI for processing, "smart" features, or training by this app.

**The three parties and what they can see:**

| Party                                              | Access to a buyer's customer data                                                                                                                      |
|----------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>You (the seller)</b>                            | <b>None.</b> Each buyer runs their <b>own</b> copy in their <b>own</b> Google account. You never receive their data.                                   |
| <b>Anthropic / Claude (the AI that built this)</b> | <b>None.</b> The AI wrote the <i>code</i> ; it has no connection to any deployed copy and no real customer data was used to build it (templates only). |
| <b>Google</b>                                      | It's the host (Sheets/Drive/Gmail/Calendar); see the "Google's own AI" note below.                                                                     |

## **The one AI nuance worth knowing: Google's own AI (Gemini)**

Because the data lives in Google Sheets/Gmail/Drive, the only AI that *could* touch it is **Google's own** (Gemini / "smart features"), and only per the buyer's Google account settings, not anything this app does. Guidance for privacy-conscious buyers:

- Consumer Gmail & Workspace: Google states your content isn't used for ads and (for Workspace) isn't used to train models outside your organization. Settings still vary.
  - To lock it down, a buyer can review **Google Account** ▶ **Data & privacy** and their **Gmail/Workspace "Smart features"** and **Gemini** settings. This is a Google-platform choice, **not** something this product controls or changes.
-

## 1. What customer PII is stored, and where

| Data                             | Where it lives                                                |
|----------------------------------|---------------------------------------------------------------|
| Name, phone, email, address      | Clients tab (the buyer's own Sheet)                           |
| Job history, service, schedule   | Jobs tab                                                      |
| Amounts owed/paid, line items    | Estimates, Invoices, LineItems tabs                           |
| Invoice/estimate <b>PDFs</b>     | The buyer's Google <b>Drive</b> (private)                     |
| Lead-form <b>raw submissions</b> | A "Form Responses" tab in the same Sheet                      |
| Job title + client name          | The buyer's Google <b>Calendar</b> (if they use that feature) |

**All of it lives inside the buyer's own Google account.** Nothing is stored by you or by us.

## 2. Where customer data leaves the account (egress), and the risks

| Egress                                                                                 | Risk to customer data                                                                                                                                                                                              | Severity                                                                                        |
|----------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------|
| <b>Emails to customers</b><br>(invoice/estimate/review/reminder) via the owner's Gmail | Wrong/mistyped email in the Clients tab → PII to the wrong person. Sent one-per-recipient (no CC leakage between customers  . | <br>Medium   |
| <b>Follow-up digest email</b> (customer names/phones) to the "Owner email" setting     | If that setting is mistyped, customer PII goes to a stranger. Defaults to the account owner  .                                | <br>Medium |
| <b>Calendar events</b> carry the client name                                           | If the buyer's Google Calendar is shared/public, client names + schedule leak.                                                                                                                                     | <br>Medium |
| <b>The lead Form</b> (public link)                                                     | Input only (can't read data), but collects PII from submitters; a second copy sits in "Form Responses".                                                                                                            | <br>Medium |
| <b>Payment link</b> (owner's Stripe/PayPal)                                            | Customer pays on that third party, out of this app's scope.                                                                                                                                                        |  Info      |

## 3. Sharing model: the biggest handling risk

- **Fulfillment master:** the seller shares the *master* Sheet "anyone with link ▶ Viewer" so buyers can copy it. **The master must contain NO real customer data:** keep it a clean template.  (It does.)
- **Buyer's working copy is private by default.** The #1 way a buyer could expose their customers is by **manually sharing their working Sheet** (to "collaborate") with anyone-with-link, or adding collaborators; everyone then sees all customer records. → Buyer guidance below.
- **Google Workspace buyers:** their org **admin** can access the Sheet. Note for business/agency buyers.

## 4. Retention & deletion (GDPR / CCPA "right to be forgotten")

The buyer (service business) is the **data controller**; they're responsible for honoring customer deletion requests. Today that's **manual**: data for one customer can sit in Clients, Leads, Jobs, Estimates, Invoices, Line Items, Form Responses, saved PDFs, and Calendar. **To erase a customer**, remove their rows from those tabs and delete their PDFs and calendar events.

 **Keep financial records as required by law.** Invoices/estimates often must be retained for tax purposes; instead of deleting them, you can **anonymize** the customer name on paid invoices rather than erase the record. When in doubt, check local requirements.

There is no automated bulk-delete (deliberately, because auto-wiping financial records is risky).

## 5. Positive properties (state these with confidence)

-  **No data ever sent to any AI or third party** (verified: no external calls at all).
-  **You (seller) and we (the AI) have zero access** to any buyer's customer data.
-  Data stays **in the buyer's own Google account**; they can export (CSV) or delete it anytime.
-  Emails go **one recipient at a time**: no customer sees another customer's address.
-  Invoice PDFs are **private** in the buyer's Drive by default.

## 6. Buyer guidance (put a short version in the delivery guide / listing)

- **Don't share your working CRM Sheet** with "anyone with the link." Keep it private; if you must add a helper, add them as a named editor and remove them when done.
- **Double-check the email** on a client before sending invoices; verify the **Owner email** in Settings is yours.
- **Job photo links are public-with-link**: only store job photos there, and only share the link with that customer.
- **To honor a delete request**: remove the customer's rows and PDFs (keep tax-required invoices, or anonymize the name).
- Your customer data is **never sent to any AI or outside service** by this app.

---

*This app makes no external network calls and stores everything inside the buyer's own Google account. The seller and the tool's author have no access to any buyer's customer data.*
