

Deploy the web app (one time, ~5 min)

The web app turns the CRM into a real app you open in any browser, including your phone. It's backed by the same Google Sheet (the tabs are the database). You only deploy once; after that you just open the URL.

Files that must be in the Apps Script project

Extensions ▶ Apps Script, make sure these exist (they all travel with the copy, nothing to paste):

- `Code.gs` : menu, automations, triggers, Form intake
- `Api.gs` : the web-app server API + `doGet`
- `db.gs` : the database schema + data layer (the CRM won't build without it)
- `setup.gs` : builds/rebuilds the tabs from the schema
- `WebApp.html` : the app UI
- `Sidebar.html` : the desktop Quick Actions panel
- `Tests.gs` : optional QA (in-editor integration test; safe to leave out)

Steps

1. In the sheet, run ⚡ CRM ▶ **Set up / rebuild database** once and approve the permissions (see the "Google hasn't verified this app" note; it's normal).
2. **Set your timezone** (so calendar events land at the right hour): **Apps Script** ▶ **Project Settings** (⚙️) ▶ **Time zone** → choose yours. The master defaults to America/Phoenix (Arizona).
3. In the Apps Script editor, click **Deploy** ▶ **New deployment**.
4. Click the gear ⚙️ ▶ **Web app**.
5. Set:
 - **Description:** CRM app (anything)
 - **Execute as:** Me
 - **Who has access:** Only myself ← ⚠️ **security-critical**. This keeps your CRM private to you. Do **not** choose "Anyone"; that would let anyone with the link read your customer data and act as you. (See `SECURITY.md`.)
6. Click **Deploy**, then **Authorize access** and allow (same one-time approval).
7. Copy the **Web app URL** (ends in `/exec`). That's your app.

Shortcut: after deploying, ⚡ CRM ▶ 📱 **Open the app (get link)** shows the URL any time.

Put it on your phone

Open the URL on your phone → browser menu → **Add to Home Screen**. Now it launches like an app. (You'll need to be signed into the same Google account.)

After you change the code later

Deploy ▶ Manage deployments ▶ (pencil ) ▶ Version: New version ▶ Deploy . The URL stays the same.

Troubleshooting: "Sorry, unable to open the file at this time" (on a computer)

This Google Drive error means the app opened under the **wrong Google account**: you're signed into more than one, and the app landed on an account that doesn't own the sheet. (It's why it can work on your phone but not your computer.) Fixes, easiest first:

1. **Incognito window** (Ctrl/Cmd+Shift+N) → paste the app URL → sign in with **only** the account that owns the sheet. This always works and confirms the cause.
2. **Make the owner account your default**: sign out of all Google accounts, then sign in with the owner account **first** (first account = default).
3. **Force the account in the URL**: insert `/u/0/` after `script.google.com`, e.g.
`https://script.google.com/u/0/macros/s/XXXX/exec` ; try `/u/1/` , `/u/2/` ... until it opens.
4. Make sure you're using the `/exec` URL from *Deploy ▶ Manage deployments*, not the `/dev` test URL (the `/dev` URL only works for the owner with editor access).

Access model (plain English)

"Execute as Me / Only myself" means the app runs as **you** and **only you** can open it (while signed into your Google account). Your data never leaves your account. If you ever want to hand access to an employee, that's a bigger change; ask before doing it.
