

Roadmap: from the expert service-CRM review

Prioritized by **impact per effort**. All items are feasible within Google Sheets + Apps Script unless noted. This is the backlog that most raises perceived value and cuts refunds.

Positioning fixes (done)

- ☒ Correct "works on your phone" → honest desktop/mobile split (TRAINING.md)
- ☒ "Please read before buying" honesty block on the Etsy listing (LISTINGS.md): Sheets-not-an-app, email-not-SMS, no built-in card payments/auto-quotes yet.

Product backlog (highest value first)

☒ P1: Quotes / Estimates (DONE)

Shared PDF engine (`generateDoc_`) now produces both estimates and invoices. New  Estimates tab; `Create & email estimate` stamps ESTIMATE with a "Valid until" date.

☒ P2: Itemized invoices + tax (DONE)

New  Line Items tab (Doc # / Description / Qty / Rate / Line Total). Invoices & estimates pull matching items, apply a Sales tax % from Settings, and show subtotal / tax / total. A single typed Amount still works (treated as the total, no double-taxing on re-run).

☒ P3: Recurring / repeat jobs (DONE)

Jobs gained a "Repeat" column (Weekly/Biweekly/Monthly) + internal "Rolled?" flag.

`rollForwardRecurringJobs` (daily trigger) auto-creates the next visit when a recurring job is marked Done. Idempotent; never spawns twice.

☒ P4: Pay-now link + SMS fallback (DONE)

- Settings "Payment link" renders a **Pay now** button in invoices (PDF + email).
- The follow-up digest email now has a tap-to-text "**Text >**" `sms:` link per lead that works on the phone where they read it, sidestepping the Twilio wall.

☒ P5: Mobile lead capture via Google Form (DONE)

`Create mobile lead-capture form` builds a Google Form (great on phones) whose submissions flow straight into the Clients tab (as new Leads) via an `onFormSubmit` trigger. URL is saved to Settings to bookmark on a phone.

Post-launch-research decisions (voice-of-customer review)

Validated the build against real demand (Reddit/forums/Quora/X + review-site complaints). Verdict: **simplicity + no-subscription + own-your-data is the wedge**, so we closed only the two highest-leverage feasible gaps and deliberately stopped, to avoid bloating the one thing users praise most.

✅ Closed

- **Google Calendar (automatic):** scheduling/rescheduling/cancelling a job in the app automatically creates/updates/removes its Google Calendar event (client address as the location), which IS the owner's phone schedule. Toggle in Settings.

⏸ Deliberately deferred (would add tabs/complexity; add only if buyers ask)

- Deposits / balance-due on invoices (niche to higher-ticket trades).
- Expense / mileage tab (modest demand).
- "Assigned To" column (only matters after they hire helper #1).

❌ Out of scope for a Sheet (disclose, don't build)

Native 2-way SMS from a business number, in-app card processing / tap-to-pay, availability-based online booking, real-time QuickBooks sync, GPS routing/dispatch. These are why \$50/mo apps exist; a \$69 Sheet can't imitate them without breaking.

Notes on hard limits (set expectations, don't try to hide)

- Custom menu + sidebar are **desktop-web only** (not in the Sheets mobile app).
- No native SMS (paid gateway required); use the `sms:` tap-to-send fallback.
- No card processing in-sheet; use payment links.
